# **ASN.1 Basics**

# Chapter 1

## Abstract Syntax Notation: ASN.1

*This chapter defines some basic ASN.1 concepts and describes several most widely used types. It is by no means an authoritative or complete reference. For more complete ASN.1 description, please refer to Olivier Dubuisson's book [Dub00] or the ASN.1 body of standards itself [ITU-T/ASN.1]*

## 1.3 ASN.1 Constructed Types

### 1.3.1 The SEQUENCE type

This is an ordered collection of other simple or constructed types. The SEQUENCE constructed type resembles the C "struct" statement.

```
Address ::= SEQUENCE {
    -- The apartment number may be omitted
    apartmentNumber      NumericString OPTIONAL,
    streetName           PrintableString,
    cityName             PrintableString,
    stateName            PrintableString,
    -- This one may be omitted too
    zipNo                NumericString OPTIONAL
}
```

### 1.3.2 The SET type

This is a collection of other simple or constructed types. Ordering is not important. The

```
-- an array of structures defined in place.  
ManyCircles ::= SEQUENCE OF SEQUENCE {  
    radius INTEGER  
}
```

### **1.3.5 The SET OF type**

The SET OF type models the bag of structures. It resembles the SEQUENCE OF type, but the order is not important: i.e. the elements may arrive in the order which is not

# **ASN.1 Compiler**

## **Chapter 2**

# **Introduction to the ASN.1 Compiler**

## **Chapter 3**

### **Quick start**

After building and installing the compi9er, the *asn1c*<sup>1</sup>

## **Chapter 4**

`check_constraints` Check that the contents of the target structure are semantically valid and constrained to appropriate implicit or explicit subtype constraints. Please refer to Section 4.3.4 on page 26.

Each of the above function takes the type descriptor (`asn_DEF_...`) and the target structure (`rect`, in the above example). The target structure is typically created by the

### 4.3.2 Encoding DER

The Distinguished Encoding Rules is the *canonical* variant of BER encoding rules. The DER is best suited to encode the structures where all the lengths are known beforehand. This is probably exactly how you want to encode: either[(v)25Ather[(v)25r[(v)2(BER)-247dencodingv manucalfiall1(-up,l)-187(the)-34((t)1ar)187gete(structure)-34(containsse)-34((the)-33(data:)-34(whiche)-34((izre) SN.1 ypdde787(asn\_DEF\_Reacat787fromy thewhiche ishats

```
    }  
}
```

As you see, the DER encoder does not write into some sort of buffer or something. It just invokes the custom function (possible, multiple times) which would save the
